Recycling Across the UK

Introduction

The Household recycling rate is a performance indicator of how much waste households are able to recycle. It is calculated simply by diving the tonnes of waste given to (or collected for) recycling, over the total waste produced. Despite having been given a target by the EU of 50% by the year 2020, the UK has stagnated around 45% for the last five years, and seems unable to progress. In many places, the recycling rate is decreasing, and there is a huge disparity across the UK with regards to how people manage their recycling.

Business Proposal:

Given this national perspective, a group of city planners have turned their attention to the city of London, which has some of the lowest recycling rates in the country.

They want to understand why some neighbourhoods perform better than others, and what correlating variables could affect the score.

Specifically, they would also like to understand if the presence of recycling centers provide an advantage to the neighborhood in terms of their score. This will enable them to understand whether they should invest in the infrastructure of new centers, or rather in public awareness campaigns to help better the recycling of each community.

Understanding the data:

What we need is a good location based API. Foursquare will provide us with the geolocations of all recycling centers in the different neighbourhoods of London. It can also provide us with other related venues, whose presence may be correlated with high recycling rates (supermarkets vs fast food outlets for instance).

This will be combined with the recycling rates given by the city of London to all its' neighborhoods. https://data.london.gov.uk/dataset/household-waste-recycling-rates-borough (https://data.london.gov.uk/dataset/household-waste-recycling-rates-borough)

Of course the 33 boroughs of london may provide a small number of data points to reliably extract correlations and to apply machine learing algorithms, so we will also extend our assumptions to the 339 councils across the UK, in the hope that some relevant inferences can be applied to the city.

To inspect the data, I will superimpose chloropleth maps over the selected geographies, dependent on recycling rate scores, and then will add the variables (eg: recycling centers) from Foursquare. This will enable us to visually indentify if there are some correlations that can be detected. We will also overlay the population cluster density. The data will then be analsed to determine the correlation, and whether we can produce a map that pinpoints where recycling centers can be placed in order to produce the greatest recycling rate score.

Starting up the Code:

Our first task is to import the required libraries that we will use throughout this project.

In [2]:

```python
#Import Libraries to perform Foursquare API query

import requests # library to handle requests
import pandas as pd # library for data analsysis
import numpy as np # library to handle data in a vectorized manner
import random # library for random number generation

#!conda install -c conda-forge geopy --yes
from geopy.geocoders import Nominatim # module to convert an address into latitude and
 longitude values

# libraries for displaying images
from IPython.display import Image
from IPython.core.display import HTML

# tranforming json file into a pandas dataframe library
from pandas.io.json import json_normalize

#!conda install -c conda-forge folium=0.5.0 --yes
import folium # plotting library

print('Folium installed')
print('Libraries imported.')
```

Folium installed
Libraries imported.

Now we have successfully imported the Foursquare data on all the recycling points across Greater London, we can start to visualize them on a map:

```
venues_map = folium.Map(location=[latitude, longitude], zoom_start=11, tiles = 'Stamen
 Toner') # generate map centred around the Conrad Hotel

# add a red circle marker to represent the Conrad Hotel
folium.features.CircleMarker(
    [latitude, longitude],
    radius=10,
    color='red',
    popup='Conrad Hotel',
    fill = True,
    fill_color = 'red',
    fill_opacity = 0.6
).add_to(venues_map)

# add the Italian restaurants as blue circle markers
for lat, lng, label in zip(dataframe_filtered.lat, dataframe_filtered.lng, dataframe_fi
ltered.categories):
    folium.features.CircleMarker(
        [lat, lng],
        radius=5,
        color='green',
        popup=label,
        fill = True,
        fill_color='green',
        fill_opacity=0.6
    ).add_to(venues_map)

# display map
venues_map
```

Make this Notebook Trusted to load map: File -> Trust Notebook

The next part of our task consists of importing the recycling rates of the different boroughs of the city, and converting it to a choropleth map. We will pass a csv file online through the pandas 'read_csv' function.

Upon first visual inspection of the data, something interesting comes to attention. A first cluster is observable close to the center of the city. Other points then appear to be spaced out across the boroughs. But this first cluster is interesting insofar that it is also situated directly in the boroughs with the worst recycling rates. Here only 17 to 20% of household waste gets recycled.

We of course cannot tell our city planners at this point that there exists an inverse correlation between recycling center availability and recycling rates. We will explore the data further to determine if we can provide our clients with any actionable insights.

In the next step I wanted to understand the gravity of the recycling rate scores found in London. So I also downloaded a table containing the data required to calculate the rates for all councils across the UK.

It would seem that 5 out of the 10 councils with the lowest recycling rates are all situated in London. It is clear that the city and the areas surrounding it have a recycling problem.

In fact London, with a cumulative recycling rate of 33%, ranks itself below the 25 percentile of councils. Nonetheless, with an interesting disparity in results between boroughs, we can try to use the foursquare API to understand what separates each neighbourhood.

Across our readings, one key insight that was found was that a driving factor behind poor recycling rate scores is the housing density. Perhaps the logic here is that people living in closer proximity use mass communal bins, which deliver less a sense of individual responsability than individual containers posted outside every house. Let's download a dataset and explore the correlation.

In [84]:

Our next step is to merge the two tables (Recyling score, and housing density), so we may more easily apply some predictive models onto it. We may replicate the exercise at a national level, since this would equip us with more data sets. Let us arrange this table first, and remove the rows that represent higher level areas.

It seems clear that the boroughs with higher housing density have on average lower recycing rates. But the areas with low recycling rates have a huge divergence between recycling rates (from 24% to 55%). Housing density appears to be an aggrevating factor, contributing to lower results, but conversely lower housing density does not contribute necessarily to higher recycling rates.

Let us see if we can draw upon the larger national dataset to gain further correlations impacting the recycling rate.

Against our hopes, it seems that we have run short of variables which could supply a better correlation of Housing Density. It remains the variable with the highest score. We will therefore proceed to build our model.

In [115]:

```python
filtered_columns_HDRR_UK = ['Code', 'Local Authority', 'RecyclingRate', 'Housing Density']
dataframe_filtered_HDRR_UK = LocalAuthority_Incidences.loc[:, filtered_columns_HDRR_UK]
dataframe_filtered_HDRR_UK.head()
```

Out[115]:

	Code	Local Authority	RecyclingRate	Housing Density
0	E07000223	Adur	35.919255	4.230926
1	E07000026	Allerdale	33.367325	0.283881
2	E07000032	Amber Valley	32.922358	1.396583
3	E07000224	Arun	41.489036	2.492890
4	E07000170	Ashfield	35.721283	3.243142

```python
import matplotlib.pyplot as plt

plt.scatter(dataframe_filtered_HDRR_UK['Housing Density'],dataframe_filtered_HDRR_UK.Re
cyclingRate,c='blue')
plt.xlabel ="Housing Density"
plt.ylabel ="Recycling Rate"
plt.show()
```

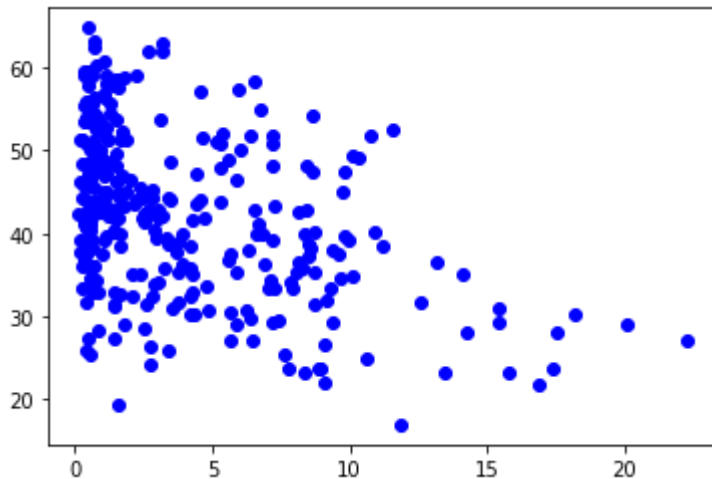

The effect seen in London seems to be replicated across the country. Areas with high housing densities appear overall unable to recycle more than 30% of their waste. After this visualisation, it seems possible that we can group areas into three sections:

1. Areas with Housing densities ranging from 0-5
2. Areas with Housing densities ranging from 5-10
3. Areas with Housing densities ranging from 10-25

We would advise our city planners on adapting their strategy to each of these three groups. Perhaps a further deep dive and be applied to this split.

Discussion

We started off exploring an assumption that recycling centers could affect recycling rate scores. This revealed not to be the case. Further readings suggested that housing density was a good variable, and upon further examination, it seems that indeed Housing Density is an aggravating factor, and quite a severe one to the point that not one council with a density over 10 is able to achieve an adequate recycling score.

Conclusion

Clearly there is another variable at play that needs to be uncovered. We hope to pursue the project further to understand the reasons why some councils outperform their recycling targets.
